

Janit Chawla

DevOps Engineer | Azure Certified | Cloud-Native & ML Infrastructure
Delhi, India • +91 7011738375 • janitchawla31@gmail.com • [LinkedIn](#) • [Blogs](#) • [Github](#)

SUMMARY

DevOps Engineer with 2.5+ years building and operating production-scale cloud-native infrastructure on AWS and Azure. Currently building a self-hosted Git platform from scratch, covering SSH auth, protocol-level access control, and multi-user isolation, alongside GPU-accelerated AI/ML infrastructure on EKS, full-stack observability, Kubernetes orchestration, CI/CD automation, and GitOps.

EXPERIENCE

DevOps Engineer • Ascendeum - Remote Oct 2024 – Present

- Architecting a custom Git hosting platform (GitLab alternative) covering SSH-based auth, clone workflow, server-side Git hooks for access control, and multi-user repo isolation
- Managing CI/CD pipelines and AWS cloud infrastructure using terraform, supporting live production services
- Established centralised observability across docker platforms using Prometheus, Loki, and Promtail for metrics and log aggregation, cadvisor, node-exporter with Grafana dashboards for visualisation reduced mean time to detect incidents from ~20 min to under 5 min
- Built and managed a scalable GPU-enabled Amazon EKS cluster for AI/ML workloads

DevOps Engineer • DeftSoft Pvt Ltd – Mohali Apr 2024 – Sep 2024

- Managed Azure DevOps pipelines, build/release automation, and App Services deployments across multiple product teams
- Maintained Jenkins and GitLab CI pipelines; managed containerised workloads via Docker and Kubernetes
- Configured docker containers as runners for gitlab pipelines

DevOps Engineer (promoted from Intern) • Xenonstack Pvt Ltd Jul 2023 – Mar 2024

- Deployed a microservices-based application on Kubernetes using Jenkins CI/CD and ArgoCD for GitOps-based continuous delivery
- Automated Node.js application deployments using Ansible for artifact distribution, rolling updates, and load balancer configuration, achieving near-zero downtime during releases
- Created Docker image build pipelines pushing to DockerHub and Harbor registries; managed ECR for AWS-hosted images

PROJECTS

Custom Git Hosting Platform (GitLab Alternative) - SSH, Git, Bash, Linux

- Designed end-to-end architecture for a self-hosted Git platform supporting repository storage, multi-user access, and SSH-based cloning, without relying on any third-party Git hosting service
- Engineered the full clone pipeline: Designed SSH-based Git access flow with protocol-level authorization and repository isolation
- Implemented server-side pre-receive and update Git hooks to intercept push/pull operations and apply fine-grained, per-user access policies before any data is transferred
- Designed multi-user isolation model ensuring users can only access repositories they are explicitly authorised for, with no cross-repo visibility

GPU EKS Cluster for AI/ML Workloads - AWS EKS, Kubernetes, Helm, CloudWatch, NVIDIA, terraform

- Provisioned a production-grade GPU-enabled Amazon EKS cluster to support AI/ML training and inference workloads, ensuring high availability and resource efficiency
- Configured VPC CNI prefix delegation to extend IP address allocation per node, significantly increasing the number of pods from 29 to 110 that can be scheduled on GPU instances
- Enabled NVIDIA GPU time-slicing at the node level, allowing multiple concurrent workloads to share GPU resources — improving utilisation and reducing infrastructure cost
- Set up CloudWatch Container Insights with custom metrics and GPU utilisation dashboards for real-time cluster health monitoring and alerting

Platform Observability Stack — Prometheus, Loki, Promtail, Grafana, Alertmanager, cadvisor, node-exporter

- Established centralised observability across all docker servers by deploying Prometheus for metrics, Loki + Promtail for log aggregation, cadvisor, node-exporter and Grafana for unified dashboards and visualisation

- Configured custom Prometheus alert rules for SLA-critical thresholds; integrated Alertmanager to route notifications to Microsoft Teams for on-call response, reduced mean time to detect incidents by 80%
- Set up Grafana → Jira integration to auto-create and assign tickets whenever a defined alert fires, reducing manual incident triage time

Node.js Application Deployment Automation — *Jenkins, Ansible, Nexus, Bash*

- Built a Jenkins CI/CD pipeline to build Node.js code, push artifacts to Nexus, and distribute them to VMs using Ansible — replacing a fully manual deployment process and reducing deployment time by 70%
- Implemented rolling updates with Ansible-managed load balancer reconfiguration and health checks, achieving near-zero downtime across version upgrades

SKILLS

Cloud: AWS (EC2, S3, EKS, ECR, IAM, VPC, Lambda, RDS), Azure (DevOps, App Services, Blobs, Service Connections)

Containers & Orchestration: Docker, Kubernetes, EKS, Helm, Harbor, DockerHub, ECR

CI/CD & IaC: Jenkins, GitLab CI, ArgoCD, Terraform, Ansible, Azure DevOps

Observability: Prometheus, Grafana, Loki, Promtail, CloudWatch, CloudTrail, cadvisor, node-exporter

Other: Bash/Shell Scripting, Python scripting, Git Internals, SSH, Networking, Linux SysAdmin

EDUCATION

B.Tech – Information Technology, GGSIPU Delhi 2019 – 2023

9.1 CGPA
